

I am excited to pursue a degree in Computer Science at Tamkang University, motivated by my long standing passion for technology and programming. My primary objective is to build a strong foundation in computer science with an emphasis on creating practical solutions to real-world problems.

In my first year, I plan to focus on developing proficiency in key programming languages such as Python and Java. I aim to strengthen my coding skills through hands-on labs and teamwork-oriented projects, as I have found that collaborative learning with classmates not only enhances understanding but also brings diverse perspectives to problem-solving.

During my second year, I want to explore deeper topics like data structures, algorithms, and database management. I look forward to joining university clubs and participating in workshops, as these activities will help me gain a more comprehensive grasp of theoretical concepts and practical applications. Additionally, I see this as a great opportunity to network with other students and industry experts.

By the third year, my goal is to study advanced areas like artificial intelligence and machine learning. I also aim to secure an internship during this period, which I consider essential for gaining valuable industry experience and directly applying what I've learned in class. Participating in programming contests and hackathons will further push my limits and refine my technical abilities.

In my final year, I'm eager to undertake a significant graduation project. Ideally, I would like to develop a useful application or software that addresses common everyday issues, demonstrating the knowledge and skills I've acquired during my studies.

Ultimately, studying at Tamkang University will provide me with the essential tools and experiences needed for a successful career in technology, whether my path leads me to software development, consulting, or another exciting field in the tech industry.
